fixed-pitch wood propellers of conventional design.

[Amdt. 35-8, 73 FR 63348, Oct. 24, 2008]

§ 35.39 Endurance test.

Endurance tests on the propeller system must be made on a representative engine in accordance with paragraph (a) or (b) of this section, as applicable, without evidence of failure or malfunction.

- (a) Fixed-pitch and ground adjustable-pitch propellers must be subjected to one of the following tests:
- (1) A 50-hour flight test in level flight or in climb. The propeller must be operated at takeoff power and rated rotational speed during at least five hours of this flight test, and at not less than 90 percent of the rated rotational speed for the remainder of the 50 hours.
- (2) A 50-hour ground test at takeoff power and rated rotational speed.
- (b) Variable-pitch propellers must be subjected to one of the following tests:
- (1) A 110-hour endurance test that must include the following conditions:
- (i) Five hours at takeoff power and rotational speed and thirty 10-minute cycles composed of:
 - (A) Acceleration from idle,
- (B) Five minutes at takeoff power and rotational speed,
 - (C) Deceleration, and
 - (D) Five minutes at idle.
- (ii) Fifty hours at maximum continuous power and rotational speed,
- (iii) Fifty hours, consisting of ten 5-hour cycles composed of:
- (A) Five accelerations and decelerations between idle and takeoff power and rotational speed,
- (B) Four and one half hours at approximately even incremental conditions from idle up to, but not including, maximum continuous power and rotational speed, and
 - (C) Thirty minutes at idle.
- (2) The operation of the propeller throughout the engine endurance tests prescribed in part 33 of this chapter.
- (c) An analysis based on tests of propellers of similar design may be used in place of the tests of paragraphs (a) and (b) of this section.

[Amdt. 35-8, 73 FR 63348, Oct. 24, 2008]

§35.40 Functional test.

The variable-pitch propeller system must be subjected to the applicable functional tests of this section. The same propeller system used in the endurance test (§35.39) must be used in the functional tests and must be driven by a representative engine on a test stand or on an airplane. The propeller must complete these tests without evidence of failure or malfunction. This test may be combined with the endurance test for accumulation of cycles.

- (a) Manually-controllable propellers. Five hundred representative flight cycles must be made across the range of pitch and rotational speed.
- (b) Governing propellers. Fifteen hundred complete cycles must be made across the range of pitch and rotational speed.
- (c) Feathering propellers. Fifty cycles of feather and unfeather operation must be made.
- (d) Reversible-pitch propellers. Two hundred complete cycles of control must be made from lowest normal pitch to maximum reverse pitch. During each cycle, the propeller must run for 30 seconds at the maximum power and rotational speed selected by the applicant for maximum reverse pitch.
- (e) An analysis based on tests of propellers of similar design may be used in place of the tests of this section.

[Amdt. 35–8, 73 FR 63349, Oct. 24, 2008]

§35.41 Overspeed and overtorque.

- (a) When the applicant seeks approval of a transient maximum propeller overspeed, the applicant must demonstrate that the propeller is capable of further operation without maintenance action at the maximum propeller overspeed condition. This may be accomplished by:
- (1) Performance of 20 runs, each of 30 seconds duration, at the maximum propeller overspeed condition; or
- (2) Analysis based on test or service experience.
- (b) When the applicant seeks approval of a transient maximum propeller overtorque, the applicant must
